

12 – Penapisan Citra dalam Ranah Frekuensi

IF4073 Interpretasi dan Pengolahan Citra

Oleh: Rinaldi Munir

Program Studi Teknik Informatika
Sekolah Teknik Elektro dan Informatika
Institut Teknologi Bandung
2023

Penapisan dalam ranah frekuensi

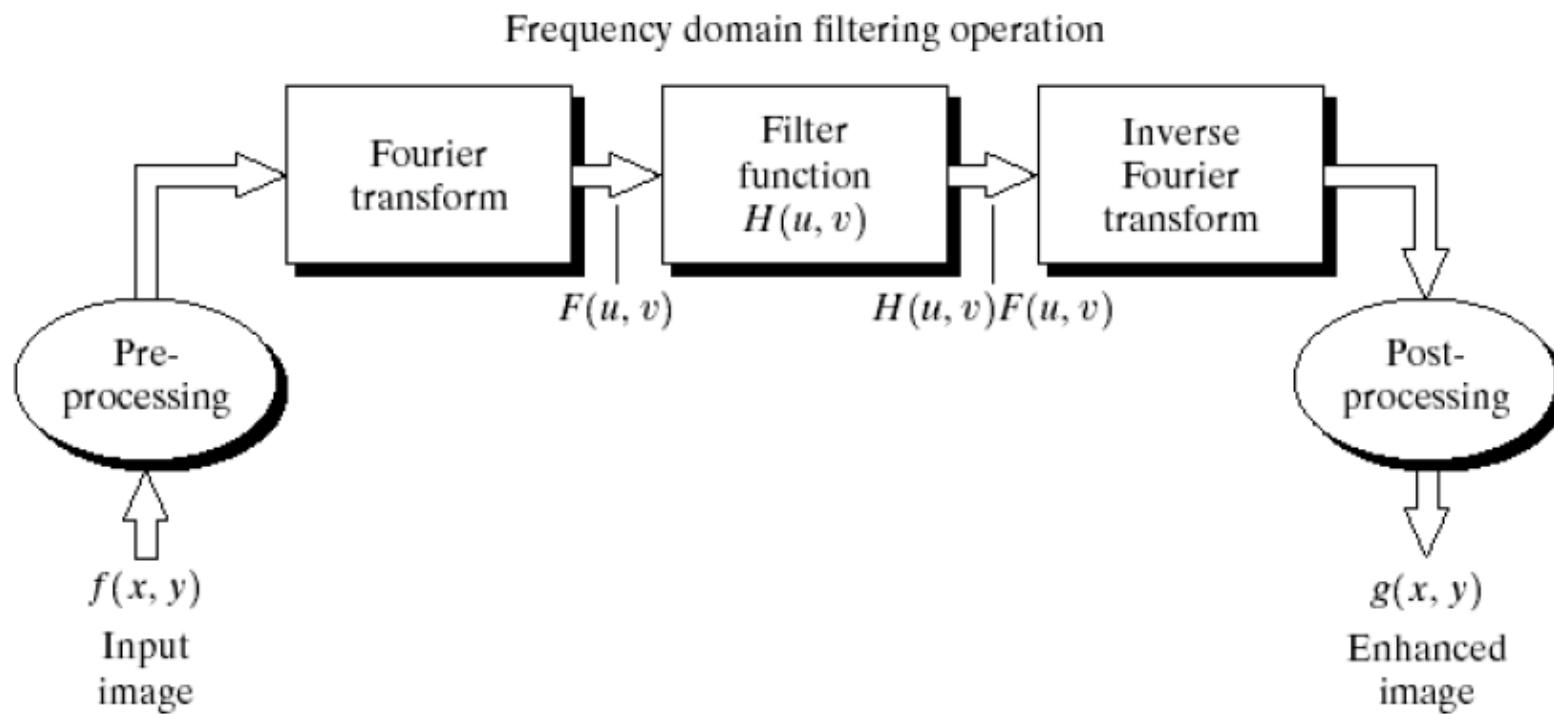

FIGURE 4.5 Basic steps for filtering in the frequency domain.

Hubungan antara operasi penapisan dalam ranah spasial dan ranah frekuensi:

$$g(x, y) = h(x, y) * f(x, y) \leftrightarrow G(u, v) = H(u, v)F(u, v)$$

dan sebaliknya: $g(x, y) = h(x, y)f(x, y) \leftrightarrow G(u, v) = H(u, v) * F(u, v)$

Catatan: ukuran matriks $H(u, v)$ dan $F(u, v)$ harus sama

```
>> A = magic(5)
```

A =

17	24	1	8	15
23	5	7	14	16
4	6	13	20	22
10	12	19	21	3
11	18	25	2	9

```
>> B = ones(5)
```

B =

1	1	1	1	1
1	1	1	1	1
1	1	1	1	1
1	1	1	1	1
1	1	1	1	1

```
>> C = fft2(A).*fft2(B)
```

C =

8125	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0

```
>> D = ifft2(C)
```

D =

325	325	325	325	325
325	325	325	325	325
325	325	325	325	325
325	325	325	325	325
325	325	325	325	325

- Perhatikan bahwa penapisan dalam ranah spasial dan dalam ranah frekuensi keduanya berkoresponden.

$$f(x,y) * h(x,y) \Leftrightarrow H(u,v)F(u,v)$$

- Contoh: citra *pepper* akan dilakukan *sharpening* pada ranah spasial dan ranah frekuensi. Penapis yang digunakan adalah

$$\begin{bmatrix} 0 & -1 & 0 \\ -1 & 5 & -1 \\ 0 & -1 & 0 \end{bmatrix}$$

$\Sigma = 1$

- Penapisan dalam ranah spasial:

```
f=imread('lada-gray.bmp');
imshow(f), title('Original image');
h = [0 -1 0; -1 5 -1; 0 -1 0];
fsharp = uint8(convn(double(f), double(h)));
figure, imshow(fsharp), title('Sharp image');
```

Original image

Sharp image

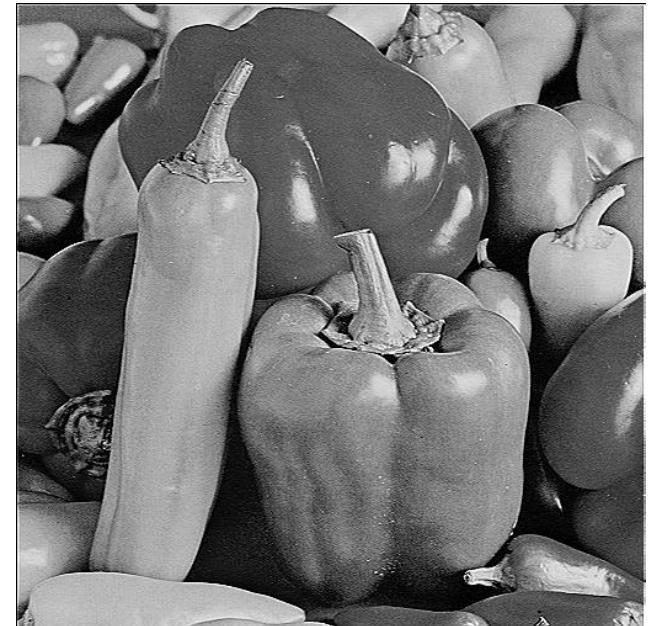

Original image

- Penapisan dalam ranah frekuensi:

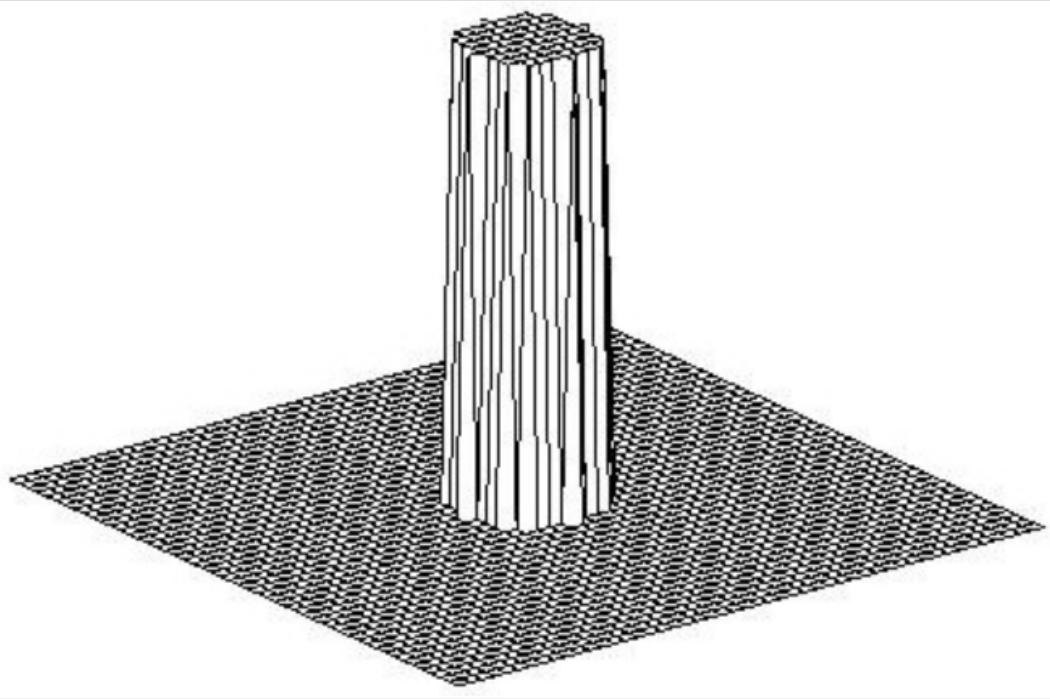

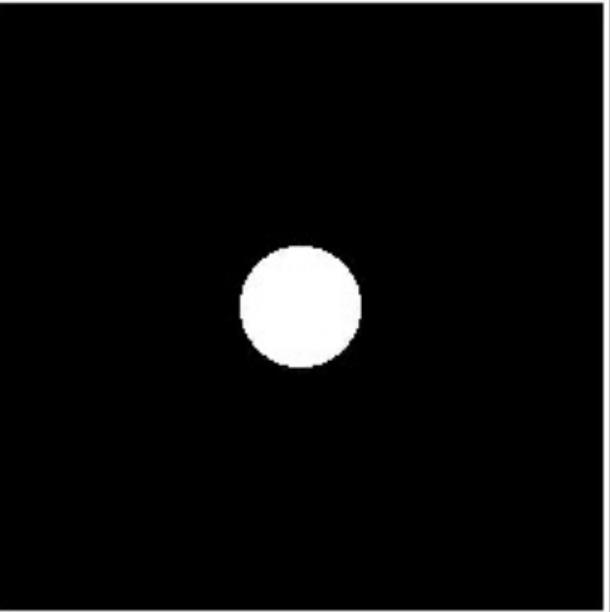

```
[f, map] = imread('lada-gray.bmp');
imshow(f, map), title('Original image');
h = [0 -1 0; -1 5 -1; 0 -1 0];
[M,N] = size(f);
F = fft2(double(f));
H = fft2(double(h),M,N);
F2 = H.*F;
f2 = ifft2(F2);
g=real(f2);
figure, imshow(g, map), title('Sharp image');
```

Sharp image

Lowpass filter (LPF) dalam ranah frekuensi

- Penapis lolos rendah (*lowpass filter*) bertujuan menekan komponen berfrekuensi tinggi dan membiarkan komponen berfrekuensi rendah relatif tidak berubah.
- Menghasilkan efek *blurring* (atau *smoothed image*)
- Tiga buah LPF yang utama:
 1. *Ideal lowpass filter* (ILPF)
 2. *Gaussian lowpass filter* (GLPF)
 3. *Butterworth lowpass filter* (BLPF)

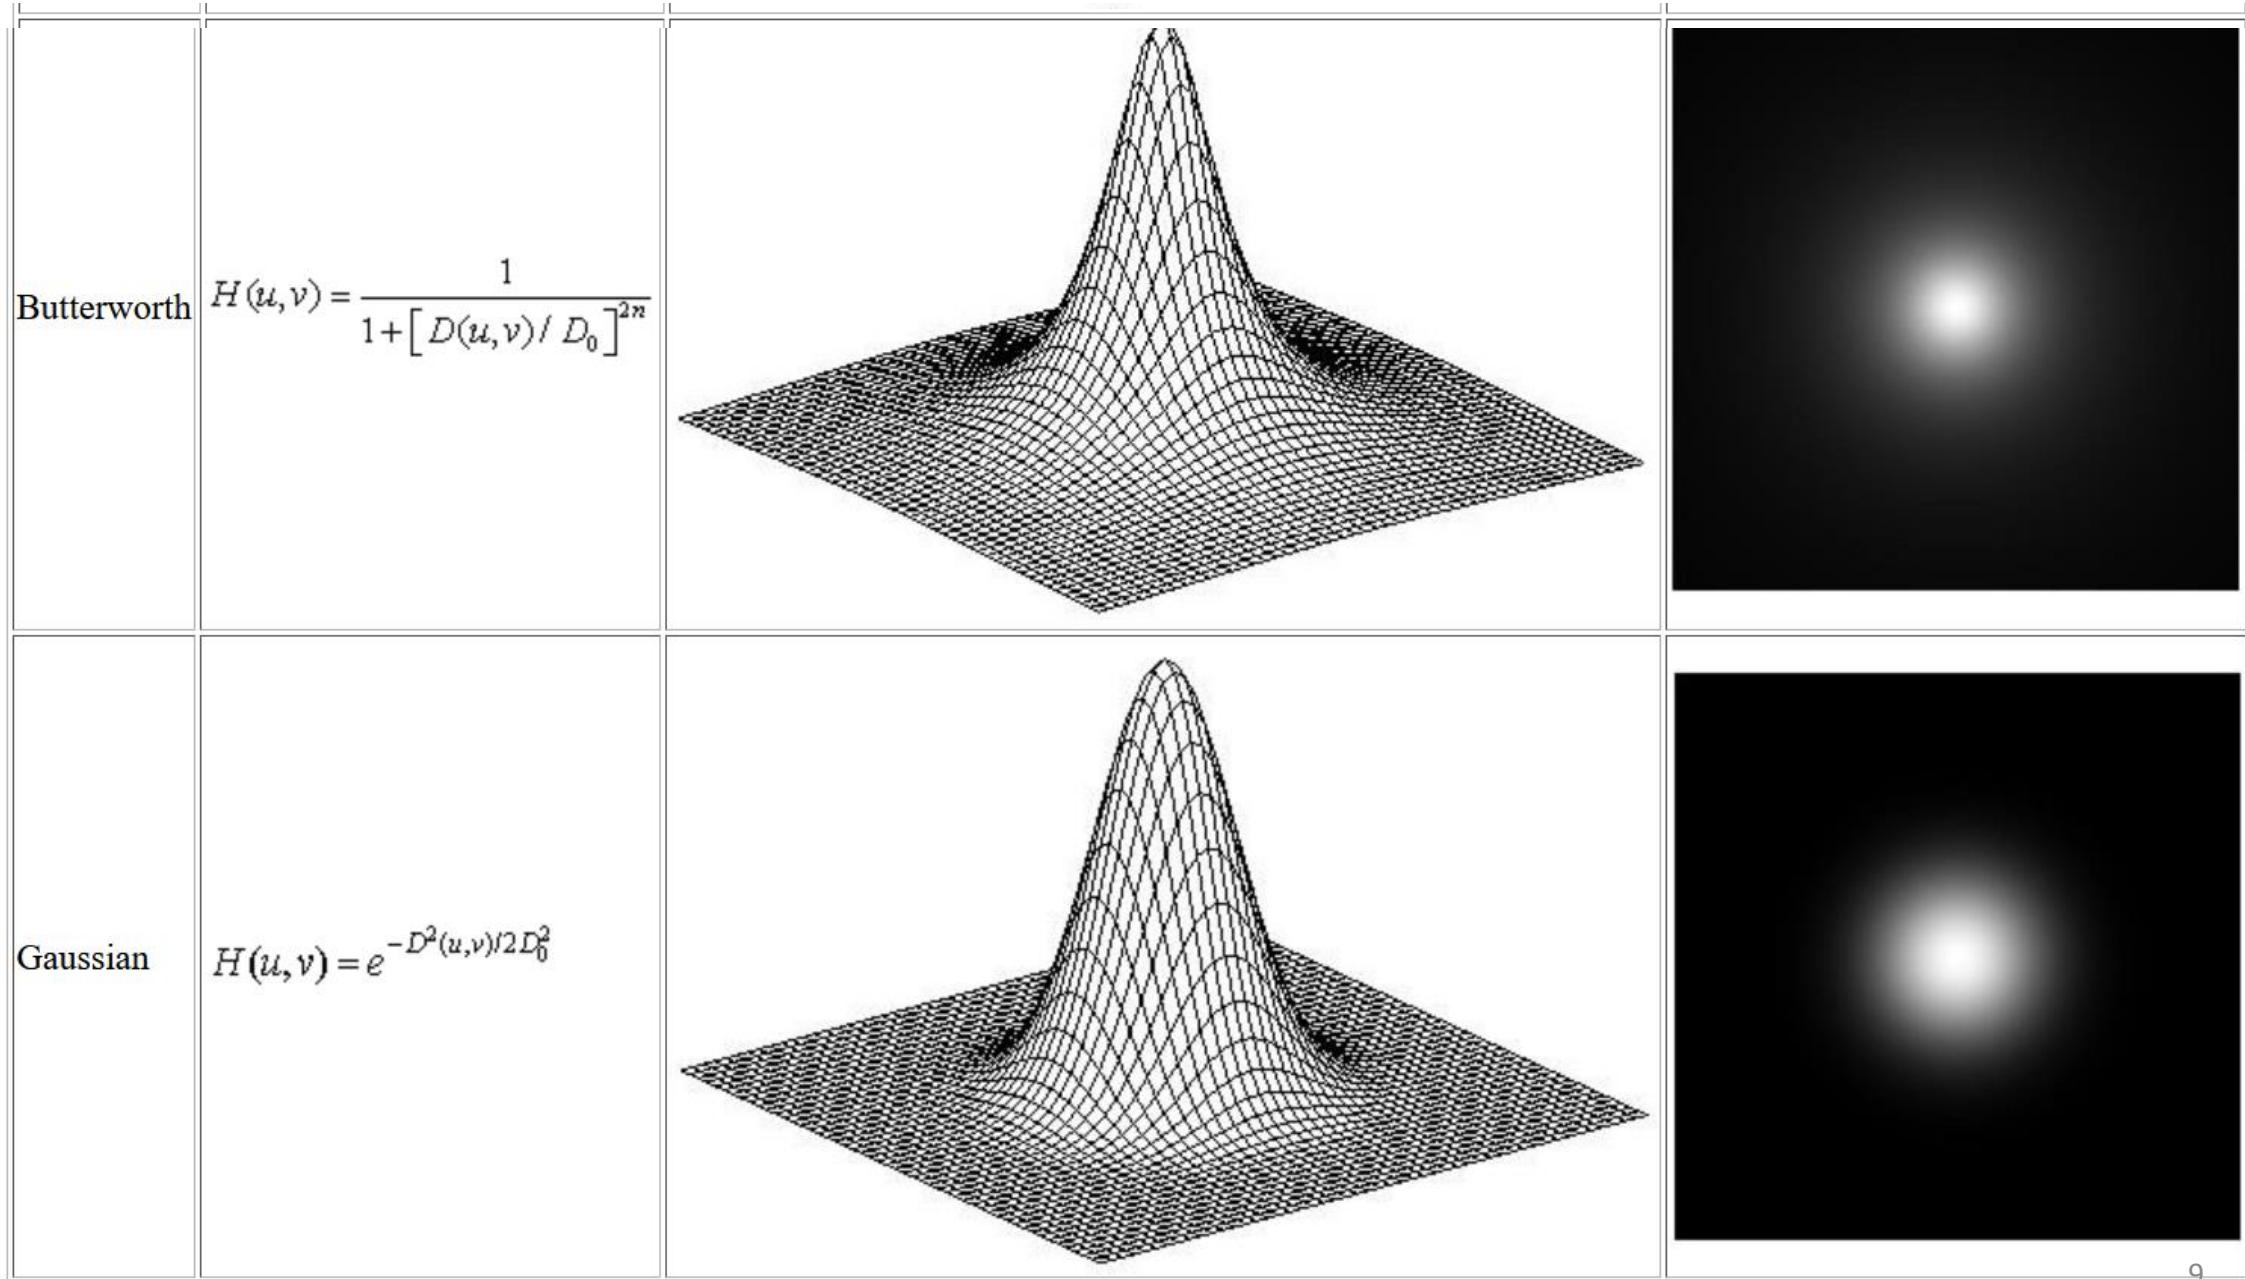

Lowpass Filter	Formula	Mesh	Image
Ideal	$H(u, v) = \begin{cases} 1 & \text{if } D(u, v) \leq D_0 \\ 0 & \text{if } D(u, v) > D_0 \end{cases}$		

Where $D(u, v)$ is the distance from point (u, v) to the center of the frequency rectangle

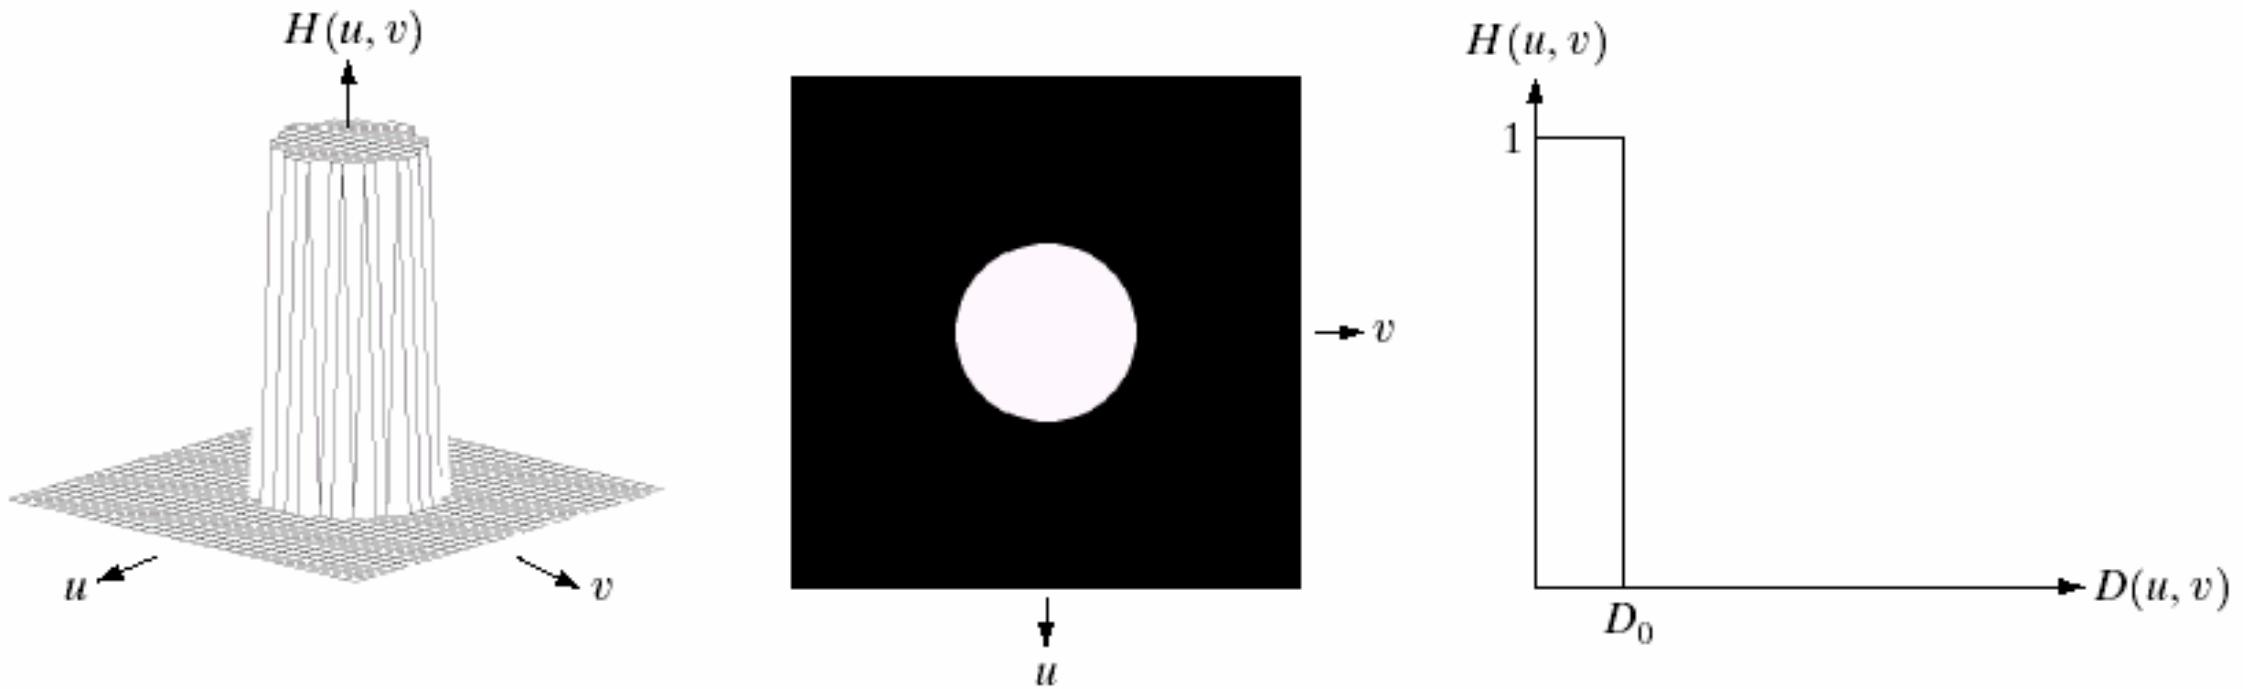

- D_0 : cutoff frequency

If the center is at $(M/2, N/2)$

$$D(u, v) = \sqrt{(u - M/2)^2 + (v - N/2)^2}$$

Ideal Low Pass Filter (ILPF)

a b | c

FIGURE 4.10 (a) Perspective plot of an ideal lowpass filter transfer function. (b) Filter displayed as an image. (c) Filter radial cross section.

Gaussian Low Pass Filter (GLPF)

$$H(u, v) = e^{-D^2(u, v)/2D_0^2}$$

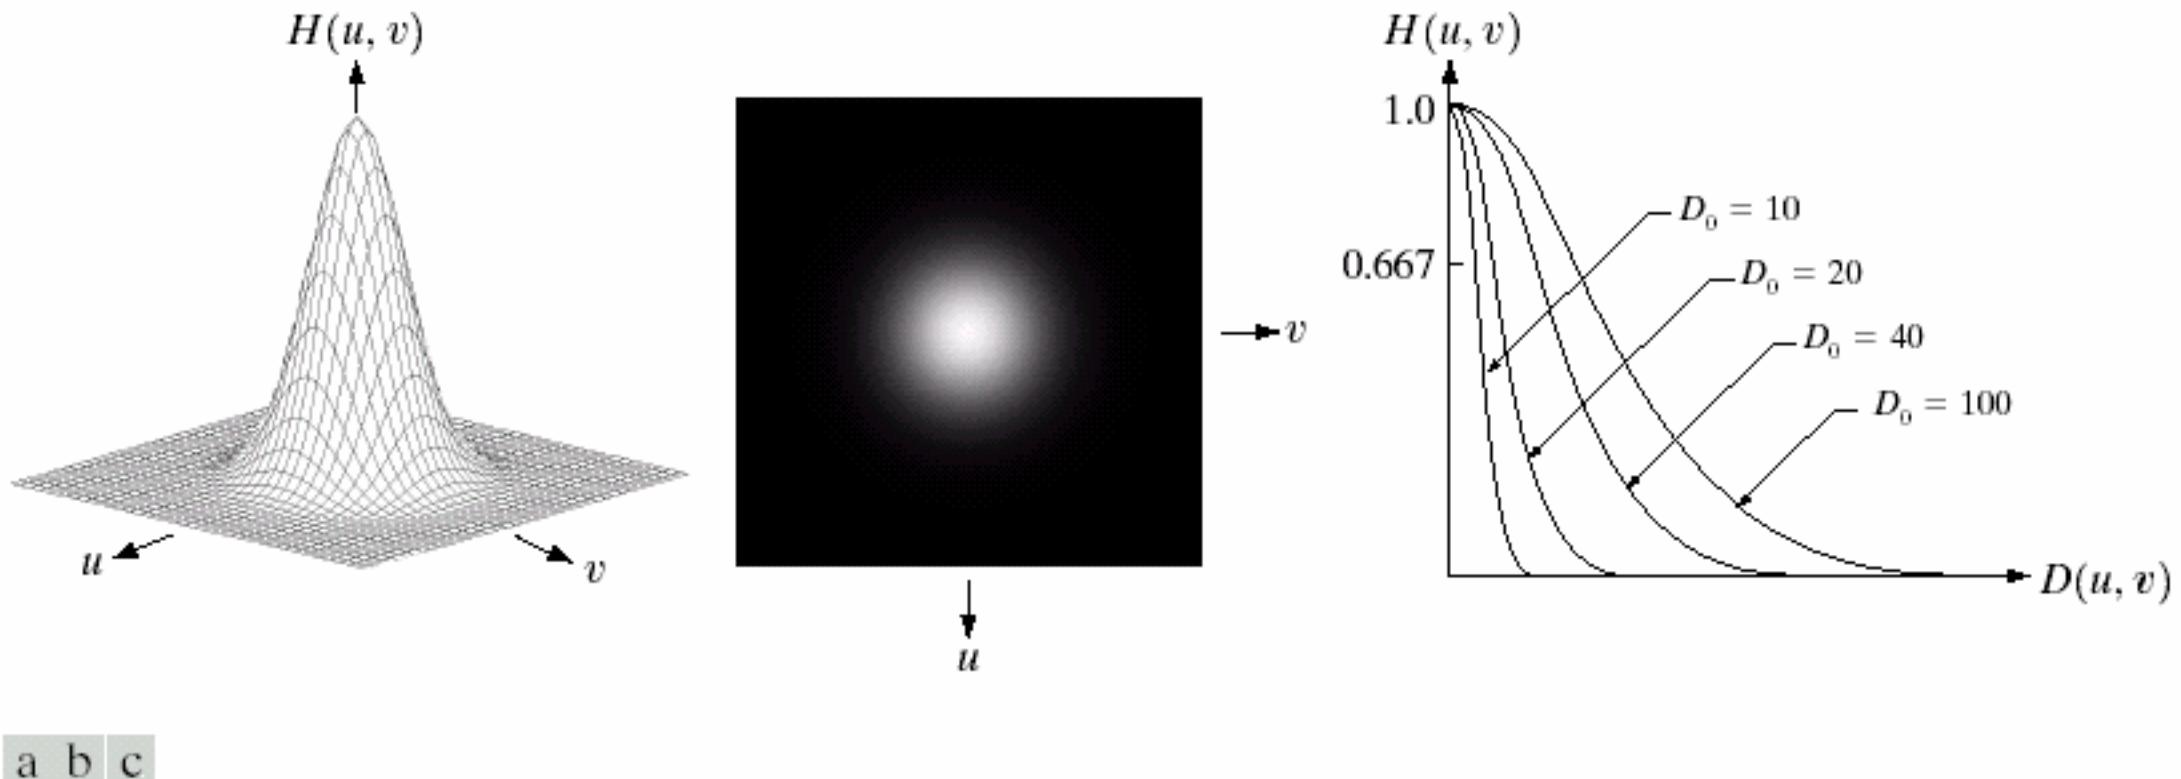

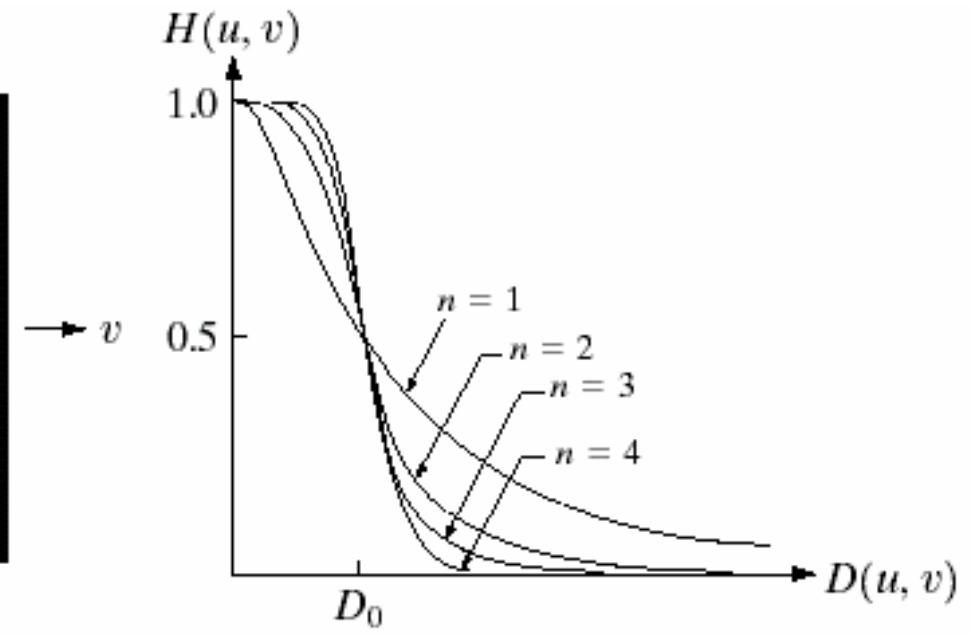

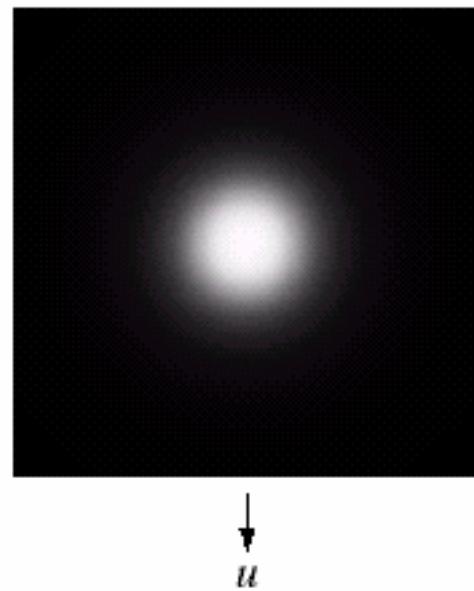

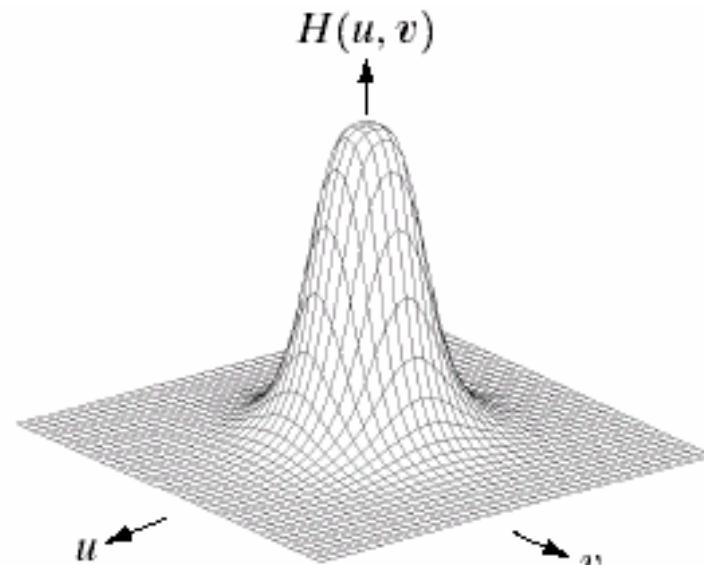

FIGURE 4.17 (a) Perspective plot of a GLPF transfer function. (b) Filter displayed as an image. (c) Filter radial cross sections for various values of D_0 .

Butterworth Pass Filter (BLPF)

$$H(u, v) = \frac{1}{1 + [D(u, v)/D_0]^{2n}}$$

n : filter order
 D_0 : cutoff frequency

a | b | c

FIGURE 4.14 (a) Perspective plot of a Butterworth lowpass filter transfer function. (b) Filter displayed as an image. (c) Filter radial cross sections of orders 1 through 4.

Langkah-Langkah penapisan dalam ranah frekuensi (dengan Matlab):

1. Tentukan parameter *padding*, biasanya untuk citra $f(x,y)$ berukuran $M \times N$, umumnya parameter *padding* P dan Q adalah $P = 2M$ and $Q = 2N$.
2. Bentuklah citra *padding* $fp(x,y)$ berukuran $P \times Q$ dengan menambahkan pixel-pixel bernilai nol pada $f(x, y)$.
3. Lakukan transformasi Fourier pada $fp(x, y)$

Kode Matlab: $F = \text{fft2}(fp);$

Catatan: Langkah 2 dan 3 dapat digabung menjadi sbb: $F = \text{fft2}(f, P, Q);$

4. Bangkitkan fungsi penapis H berukuran $P \times Q$

Catatan: jika penapis diambil dari matriks pada ranah spasial, transformasi penapis dengan Fourier transform.

5. Kalikan F dengan H

Kode Matlab: $G=H.*F;$

6. Ambil bagian real dari inverse FFT of G:

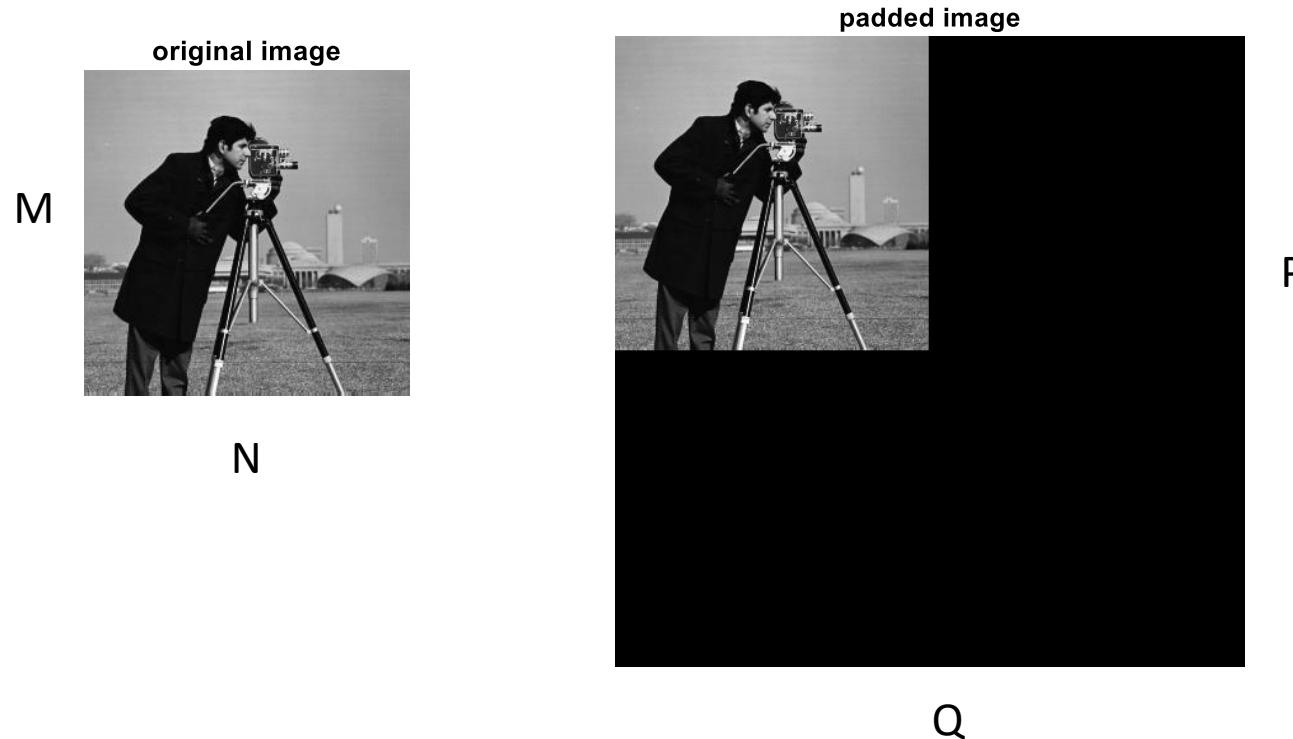

Kode Matlab: $g=\text{real}(\text{ifft2}(G));$

7. Potong bagian kiri atas sehingga menjadi berukuran citra semula

$g=g(1:\text{size}(f,1), 1:\text{size}(f,2));$

Catatan:

Langkah *padding* (1 dan 2) adalah opsional, bertujuan agar citra $f(x,y)$ dan penapis $H(u,v)$ memiliki ukuran yang sama

```

% Penapisan dalam ranah frekuensi dengan Ideal Lowpass Filter (ILPF)
f = imread('camera.bmp');
imshow(f);
[M, N] = size(f);
%Step 1: Tentukan parameter padding, biasanya untuk citra f(x,y)
% berukuran M x N, parameter padding P dan Q adalah P = 2M and Q = 2N.
P = 2*M;
Q = 2*N;

%Step 2: Bentuklah citra padding fp(x,y) berukuran P X Q dengan
% menambahkan pixel-pixel bernilai nol pada f(x, y).
f = im2double(f);
for i = 1:P
    for j = 1:Q
        if i <= M && j <= N
            fp(i,j) = f(i,j);
        else
            fp(i,j) = 0;
        end
    end
end
imshow(f); title('original image');
figure; imshow(fp); title('padded image');

```

```

% Display the Fourier Spectrum
Fc=fftshift(fft2(fp)); % move the origin of the transform to the center of
the frequency rectangle
S2=log(1+abs(Fc)); % use abs to compute the magnitude (handling imaginary)
and use log to brighten display
figure, imshow(S2,[]); title('Fourier spectrum');

%Step 3: Lakukan transformasi Fourier pada fpad(x, y)
F = fft2(double(fp));

%Step 4: Bangkitkan fungsi penapis H berukuran P x Q, misalkan penapis
%yang digunakan adalah Ideal Lowpass Filter (ILPF)

D0 = 50; % cut-off frequency
% Set up range of variables.
u = 0:(P-1);
v = 0:(Q-1);

% Compute the indices for use in meshgrid
idx = find(u > P/2);
u(idx) = u(idx) - P;
idy = find(v > Q/2);
v(idy) = v(idy) - Q;

```

```

% Compute the meshgrid arrays
[V, U] = meshgrid(v, u);
D = sqrt(U.^2 + V.^2);

H = double(D <=D0);
H = fftshift(H); figure;imshow(H);title('LPF Ideal Mask');
figure, mesh(H);

%Step 5: Kalikan F dengan H
H = ifftshift(H);
LPF_f = H.*F;

%Step 6: Ambil bagian real dari inverse FFT of G:
LPF_f2=real(ifft2(LPF_f)); % apply the inverse, discrete Fourier transform
figure; imshow(LPF_f2);title('output image after inverse 2D DFT');

%Step 7: Potong bagian kiri atas sehingga menjadi berukuran citra semula
LPF_f2=LPF_f2(1:M, 1:N); % Resize the image to undo padding
figure, imshow(LPF_f2); title('output image');

```

LPF Ideal Mask

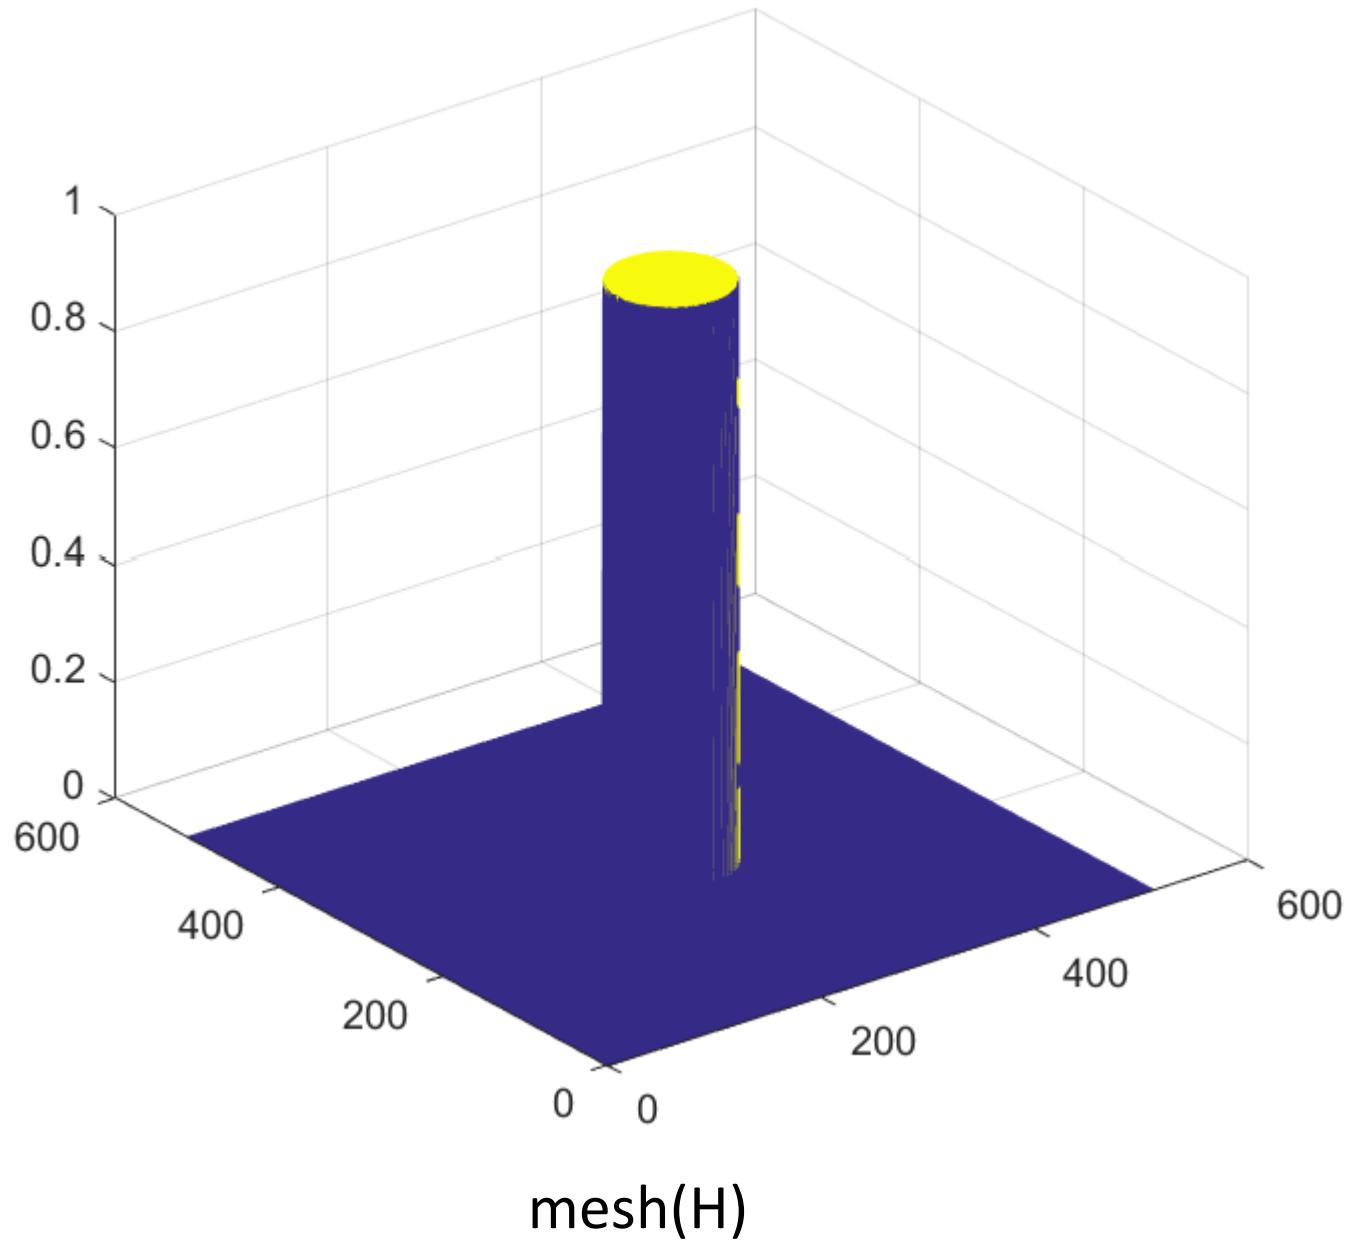

output image after inverse 2D DFT

output image

Hasil run program
dengan ILPF, $D_0 = 50$

Catatan: *Padding* tidak selalu harus dilakukan, program di atas tetap benar jika tidak dilakukan *padding*, yaitu $P = M$, dan $Q = N$.

Semula:

```
% Penapisan dalam ranah frekuensi  
% dengan Ideal Lowpass Filter (ILPF)  
f=imread('camera.bmp');  
imshow(f);  
[M,N] = size(f);  
% Step 1: Tentukan parameter padding,  
% biasanya untuk citra f(x,y)  
% berukuran M x N, parameter padding P dan Q  
% adalah P = 2M and Q = 2N.  
P = 2*M;  
Q = 2*N;
```

Menjadi

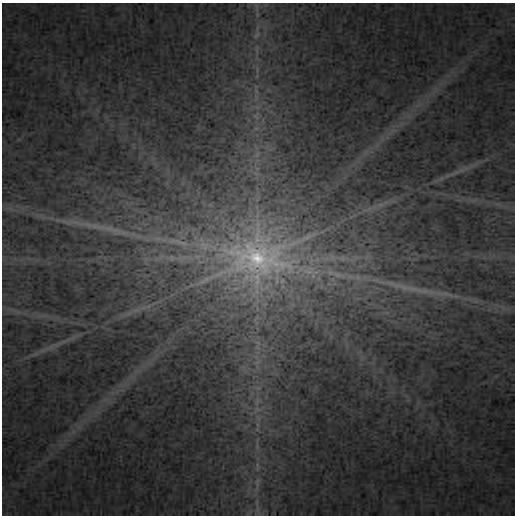

```
% Penapisan dalam ranah frekuensi  
% dengan Ideal Lowpass Filter (ILPF)  
f=imread('camera.bmp');  
imshow(f);  
[M,N] = size(f);  
%Step 1: Tentukan parameter padding,  
% biasanya untuk citra f(x,y)  
% berukuran M x N, parameter padding  
% P dan Q adalah P = 2M and Q = 2N.  
P = M;  
Q = N;
```

Hasil run program:

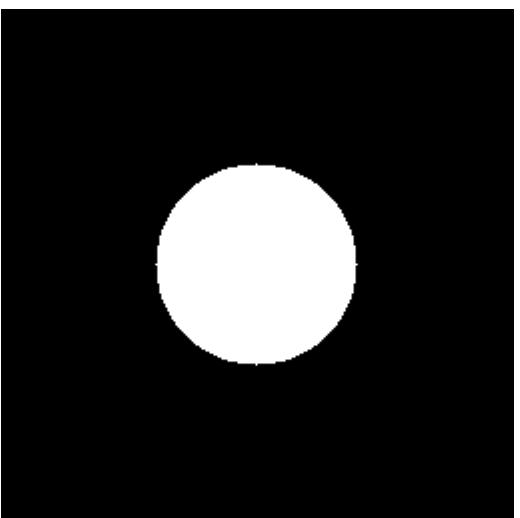

original image

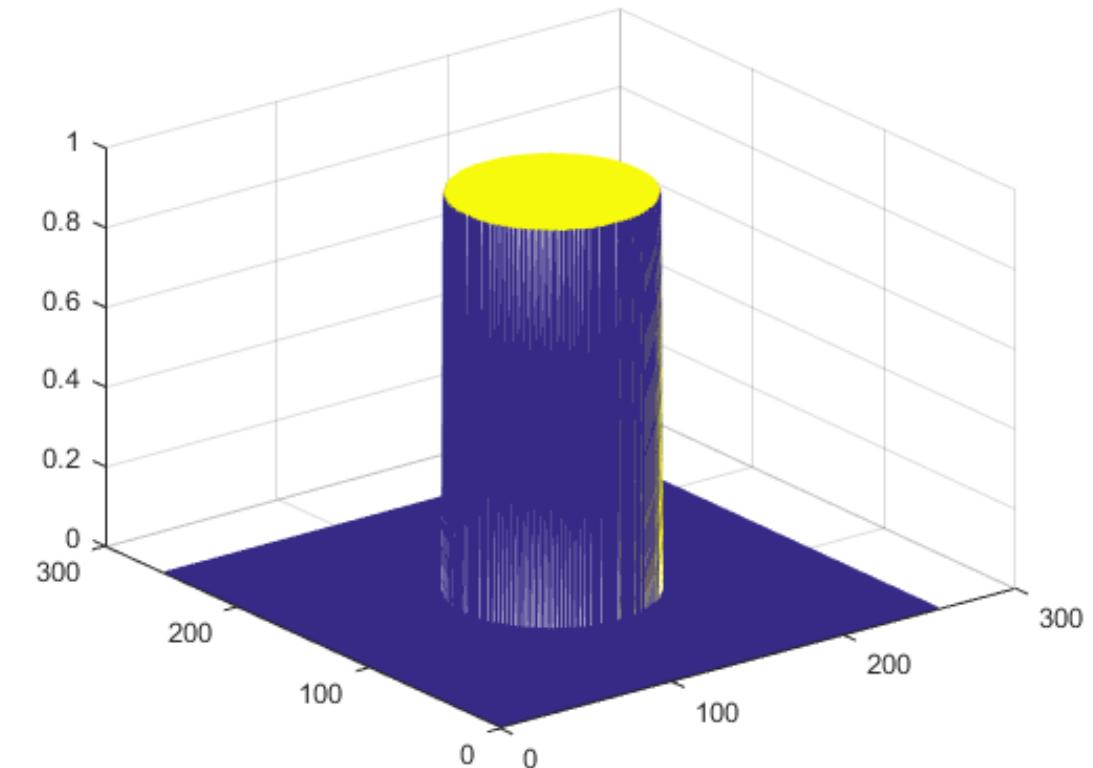

Fourier spectrum

LPF Ideal Mask

output image

Catatan:

- Untuk GLPF, maka

```
H = double(D <=D0);
```

diganti dengan

```
H = exp(-(D.^2)./(2*(D0^2)));
```

- Untuk LPF butterwoth orde n, maka

```
n = 1; % default
```

```
H = 1./(1 + (D./D0).^^(2*n));
```

```

% Penapisan dalam ranah frekuensi dengan Gaussian Lowpass Filter (ILPF)

Highpass filter (HPF) dalam ranah frekuensi

- Penapis lolos tinggi (*highpass filter*) bertujuan menekan komponen berfrekuensi rendah dan meloloskan (sekaligus memperkuat) komponen berfrekuensi tinggi.
- Menghasilkan efek penajaman pada tepi (edge) citra (atau *sharpened image*)
- Hubungan antara penapis lolos tinggi (H_{hp}) dan penapis lolos rendah (H_{lp})

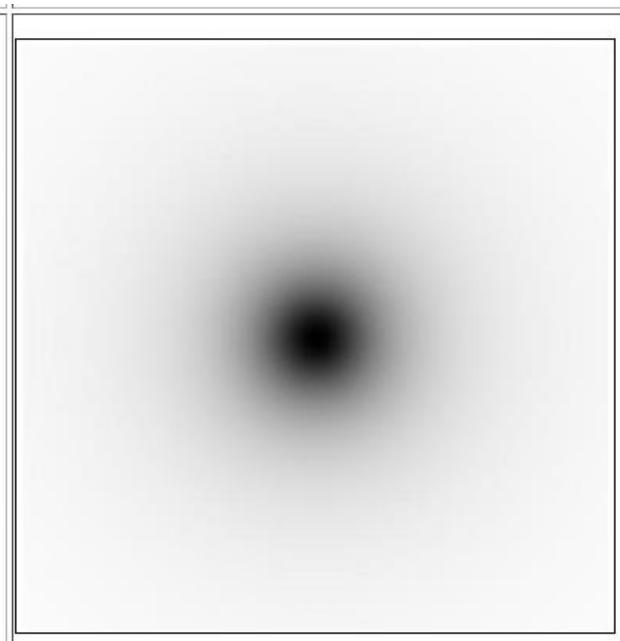

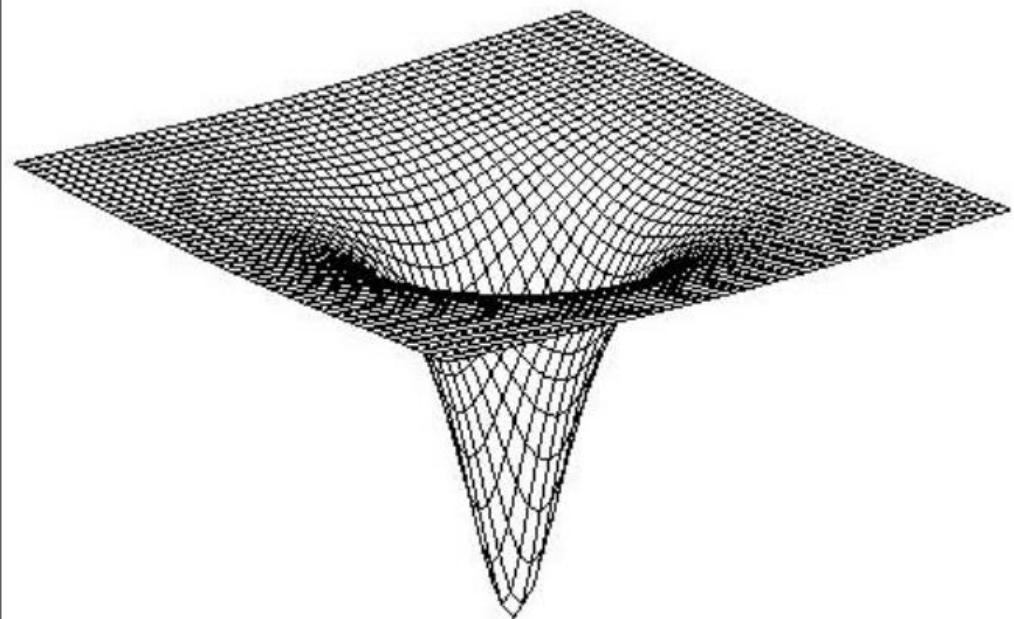

$$H_{hp}(u, v) = 1 - H_{lp}(u, v)$$

- Tiga buah HPF yang utama:
 1. *Ideal highpass filter* (IHPF)
 2. *Butterworth highpass filter* (BHPF)
 3. *Gaussian highpass filter* (GHPF)

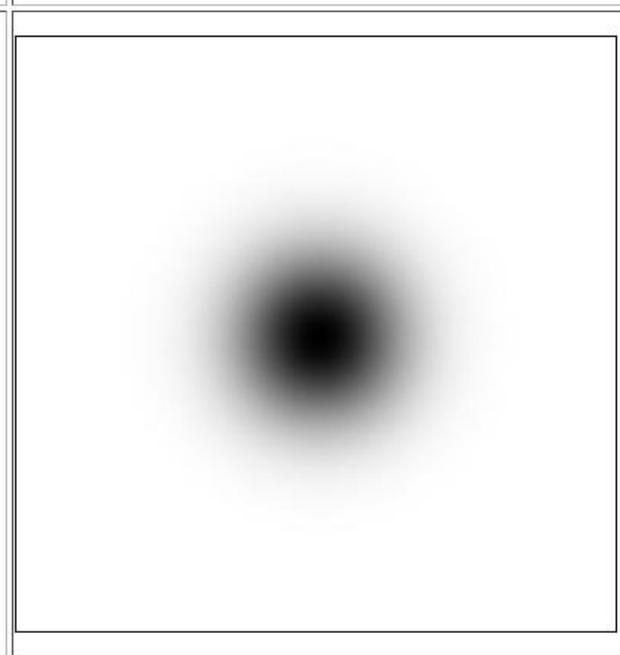

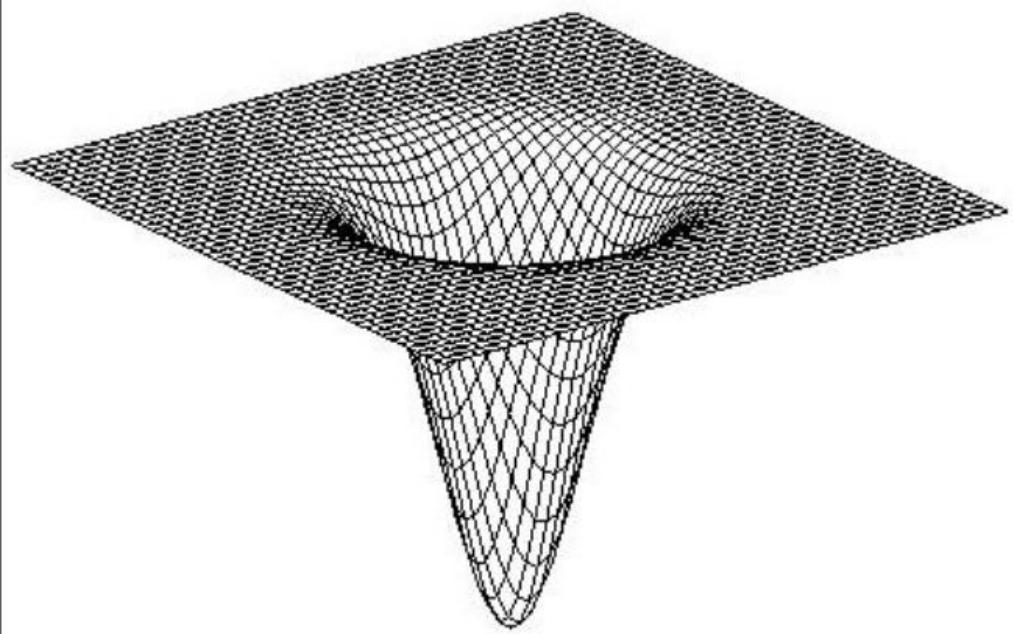

$$H(u, v) = \begin{cases} 0 & \text{if } D(u, v) \leq D_0 \\ 1 & \text{if } D(u, v) > D_0 \end{cases}$$

Butterworth

$$H(u, v) = \frac{1}{1 + [D_0/D(u, v)]^{2n}}$$

Gaussian

$$H(u, v) = 1 - e^{-D^2(u, v)/2D_0^2}$$

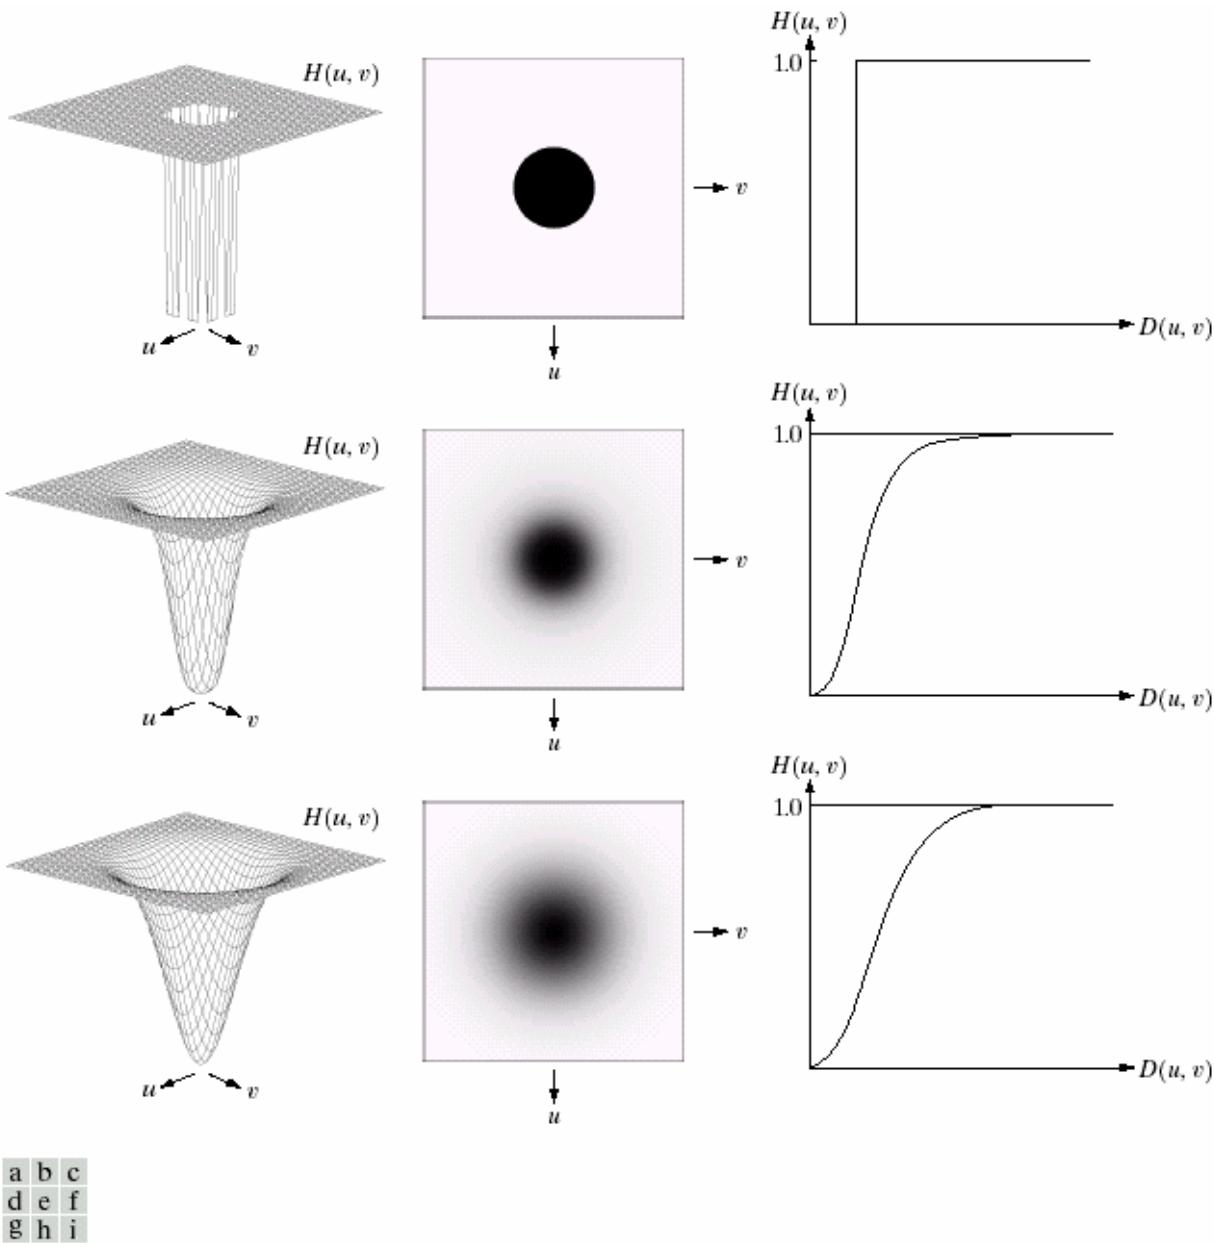

FIGURE 4.22 Top row: Perspective plot, image representation, and cross section of a typical ideal highpass filter. Middle and bottom rows: The same sequence for typical Butterworth and Gaussian highpass filters.

Unsharp Masking dan High-Boost Filtering dalam Ranah Frekuensi

- **Unsharp Masking:** $f_s(x, y) = f(x, y) - f_{lp}(x, y)$

$$F_s(u, v) = F(u, v) - F_{lp}(u, v) = \underbrace{(1 - H_{lp}(u, v))}_{H_{hp}(u, v)} F(u, v)$$

- **High-Boost Filtering:** $f_{hb}(x, y) = Af(x, y) - f_{lp}(x, y)$
$$(A \geq 1)$$

$$\begin{aligned} F_{hb}(u, v) &= AF(u, v) - F_{lp}(u, v) = \\ &= (A - H_{lp}(u, v))F(u, v) = (A - 1 + H_{hp}(u, v))F(u, v) \end{aligned}$$
